PROJECT REPORT

Project – Machine Learning based Vehicle Performance Analyzer

TEAM ID : PNT2022TMID15686

INTRODUCTION:

The rapidly expandingdiscipline of data science includesmachine learning as a key element.Algorithms are trainedto generate classifications or predictions using statistical techniques, revealing important insights in data mining operations. The decisions made as a result of these insightsinfluence key growth indicators in applications and enterprises, ideally. Data scientists will be more in demand as big data develops and grows because they will be needed to help identify the most important business issues and then the data to answer them. Machine learningis a subfield of artificial intelligence (AI) and computer science that focuses on usingdata and algorithms to mimic human learning processes and progressively increase accuracy.

1.1 PROJECT OVERVIEW

This project implies applied data science concepts and concepts of machine learning to the dataset thatis collected as a part of the preparation phaseto analyze and predict vehicle performance using a machine learning providing high accuracy and effficiency. In this project mulitple regression models are trained on the obtained dataset and checked for accuracy and tested for the suitability of the problem. Among different models that were trained decision tree regression have proven to be most effective with higher accuracy.Hence this model is saved for future predictions on vehicle performance given by the user which is obtained using a web application. This machine learning model is integrated with the web application with the help of a flask app. The entire application is also deployed on IBM cloud as a part of this project. On the other hand the project planningand management is implemented on Agile methodology where after each and every phase testing processis done. Here we performperformance and user acceptance testing after each sprint to ensure that the projectstays on trackand achieving its objectives on time.

1.2 PURPOSE

The main purpose of this project is to enable users to analyze their vehicle condition based on its performance. Predicting a car's performance level is a significant and intriguing challenge. Predicting a car's performance in order to change a certain behaviour of the vehicle is the major objective of the current study. This can drastically reduce the fuel consumption of the system and boost efficiency. Analysis of the car's performance based on the horsepower, fuel type, engine type, and the numberof cylinders. These are the variables that can be used to forecast the condition of the vehicle. The process of gathering, investigating, interpreting, and documenting health data based on the aforementioned three elements is ongoing. For the prediction engine and engine management system, performance goals like mileage, dependability, flexibility, and cost can be integrated together and arecrucial.

This strategy is a crucial first step in comprehending how a vehicle performs. To increase the performance efficiency of the vehicle, it is crucial to examine the elements utilising a variety of well-known machine learning methodologies, including as linear regression, decision trees, and random forests. Automobile engineering's "hot subjects" right now revolve around the power, longevity, and range of automotive traction batteries. We also take a performance in mileage into account here. We will create the models, utilising various techniques and neural networks, to resolve this issue. Then, we'll compare which algorithm accurately forecasts car performance (Mileage).

2. LITERATURE SURVEY

Here are some of the literature survey done to analyse different exiting models and to identify the right data and the machine learningmodel to approach the problem.

1. **An approach of modeling on dynamic performance evaluation for off- road vehicle**

Authors:

Junshu Han Institute of MedicalEquipment, Academy of Military MedicalSciences, Tianjin, China

Zhenhai Gao Institute of MedicalEquipment, Academy of Military MedicalSciences, Tianjin, China

Shulin Tan Institute of MedicalEquipment, Academy of Military MedicalSciences, Tianjin, China

Xiangdong Cui Institute of MedicalEquipment, Academy of Military MedicalSciences, Tianjin, China

Published in: 2010 8th World Congress on Intelligent Control and Automation

Abstract:

Automobile dynamic is one of the most important performance indexes, the key is whether the simulation accords with the real status, whether the vehicle performance under real driving conditions can be reflected more validly, and it will be used to estimate automobile dynamic accurately, or to provide theory reference for vehicle design. On the point of view of using vehicle, considering the effects of external factors as air velocity, tyre slip, adhesion coefficient on vehicle dynamic performance, a novel method on dynamic performance evaluation is established, and the effectiveness of the dynamic performance model is vertified.

2. Steering performance simulation of three-axle vehicle with multi-axle dynamic steering

Authors:

Shufeng Wang College of Transportation and Vehicle Engineering, Shandong University of Technology, Zibo, China

Junyou Zhang College of Transportation and Vehicle Engineering, Shandong University of Technology, Zibo, China

Huashi Li College of Transportation and Vehicle Engineering, Shandong University of Technology, Zibo, China

Published in: 2008 IEEE Vehicle Power and Propulsion Conference

Abstract:

Because three-axle heavy-vehicle with front-wheel steeringhas big radius at low speed and bad stability at high speed, in order to improve heavy vehicle steering performance at different speed, the multi-axle dynamic steering technology is put forward. Selecting zero side-slip angle of mass centre and proportional control strategy to control vehicle,Using MATLAB, the steering performance of the three-axle vehicle with different steering modes are simulated. The result shows that multi-axle dynamicsteering can decreasethe steering radiusat low speed and improve vehicle stability at high speed.

3. Simulation study on synthetical performance of electric vehicles

Authors:

Sun Fengchun Electric Vehicle Research and Development Center

Beijing Institute Technology, Beijing, China

Sun Liqiug

Zhu Jiaguang Electric Vehicle Research and Development Center

Beijing Institute of Technology, Beijing, China

Published in: Proceedings of the IEEE International Vehicle Electronics Conference (IVEC'99) (Cat. No.99EX257)

Abstract:

This paper presents the software development on the performance simulation of electric vehicles. Software verification is carried out via the comparison of simulation results with on-road test. Applications of the software in prototype design are also presented in terms of theoretical inference, modeling, software development and simulation of synthetical performance for EVs such as dynamic performance, economyperformance as well as analysisof parameters' influences on EV performance. The commonly used European drive cycle is adopted for simulation in the paper. Simulation with the software proves an efficient and money-saving means for prototyping of EV or HEV systems with control units.

4. Simulation and Analysis of Performance of a Pure Electric Vehicle with a Super-capacitor

Authors

N Jinrui

School of mechanical and vehicular engineering, Beijing Institute of Technology, Beijing, China

W Zhif

School of mechanical and vehicular engineering, Beijing Institute of Technology, Beijing, China

Published in: 2006 IEEE Vehicle Power and Propulsion Conference

Abstract:

Energy storage and power boost are major problems in the development of electric vehicles (EV). Installing a super-capacitor as an auxiliary power source to improve the performance of electric vehiclesis a feasible and realistic solution. In this paper, the structureof a multi-energy system and the principles of flow of the multi energy of electric vehicles were introduced first, explaining how different sources of energy work in different situations. A model of electric vehicle with a batteryand a super- capacitor, based on Matlab/Simulink was built up. The model was validated by comparing the simulation results and the actual data from later field tests. The drive cycle used in the simulation was the CYC_CONST_45. Comparisons were made between the model of the vehicle with a super- capacitor and the modelof a vehicle without a super-capacitor. Field tests of an electric vehicle were conduct and analyses were made. The analysis includes vehicle dynamic performance and economical performance in urban environments where the vehicle accelerated and decelerated frequently. The results showed that installing a super-capacitor improves the working conditions of the battery. The variation of the current drawn by the vehicle was smoothed due to the working of the super-capacitor, which provided better working conditions for the battery and increased

the operating life of the battery.

5. Steering feel study on the performance of EPS Authors:

Xin. Zhang
School of Mechanical, Electric and Control Engineering, Beijing Jiaotong University, Beijing, China

Published in: 2008 IEEE Vehicle Power and Propulsion Conference

Abstract:

The steering feel study is very important in the development of electric power steering system (EPS). This paper describes a method about how to evaluate and get the suitablesteering feel when driving a vehicle equippedwith EPS. The EPS steering feel subjective tests were performed to obtain objective quality parameters that correlate with subjective evaluation. Afterthis, the paper briefly describes the statistical technique used to identify whichparameters best correlate with vehicle steering qualities. As there was no correlation between a single partial rating and a single objective indicator, the principal component analysis (PCA) method was chosen and obtained objective indices. The objective evaluation parameters have been validatedby drivers psila subjective evaluation. In the third part, the analytical method was applied to vehicle dynamic analysis to analyze vehicle steering feel characteristics, we established a closed-loop steering feel simulation model to analyze steering torque characteristics, vehicle dynamic response and assess

steering feel performance for different settings of a EPS system. The design of EPS was optimized and achieved more suitable driving feel by using the dynamic analysis model without plenty of real vehicle tests. This method make it possible to easily and accurately benchmark steering dynamic characteristics, set design targets,and is helpful to achievegood steering feel.

6. Study on the performance and control of SR machine for vehicle regenerative braking

Authors:

Xiaoling Yuan
College of Electrical Engineering, Hohai University, HHU, Nanjing, Jiangsu, China

Yimin Gao
Department of Electrical Engineering, Texas A and M University, College Station, TX, USA

Department of Electrical Engineering, Texas A and M University, College Station, TX, USA8

Published in: 2008 IEEE Vehicle Power and Propulsion Conference

Abstract:

A regenerative braking system with simple structure, high efficiency, good performance and easy control is crucial for electric vehicle (EV), hybrid electric vehicle (HEV) and fuel cell vehicle (FCV). SR machine is one of the promising candidates. In this paper, the current and torque performance of a SR machine for application to vehicle regenerative braking has been studied. The relationship between the torque, speed, turn-on and turn-off angles has been established. The data obtained through simulation is very useful for vehicle control design.

2. EXISTING PROBLEM

The main problem in predicting machine learning is that different model suits for different situations but identifying which model suits overall with only some loss is crucial. So we need to train different regression models on the given data and identify which model suits our particular scenario and dataset so that it could be carried on for predicting purposes.

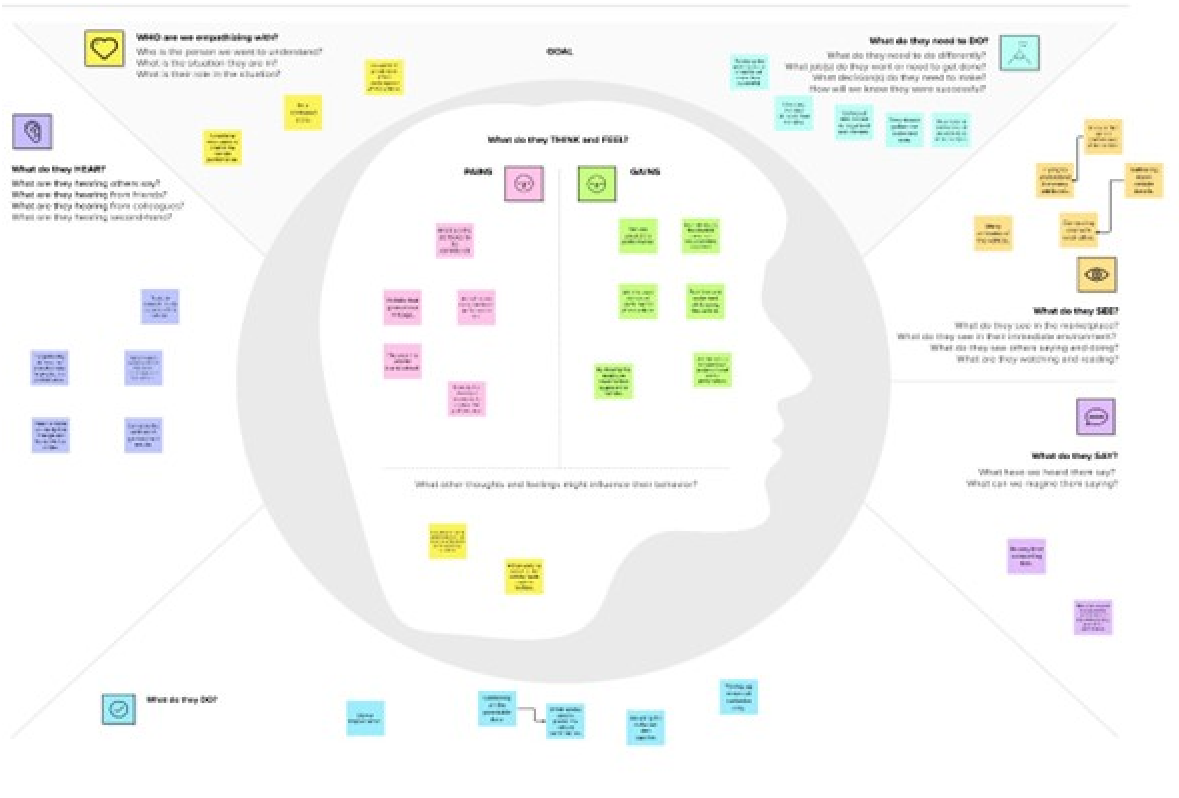
2.3 PROBLEM STATEMENT DEFNITION

I am	**I am trying to**	**But**	**Because**	**Which makes me feel**
Owner of a vehicle.	Owner of a vehicle.	I don’t know which aspect to focus more.	A very large of factors impact performance.	Confused
Owner of a vehicle.	Analyze the performance ofvehicle.	Can’t focus on every single car.	There are a variety of cars at different prices	Little worried

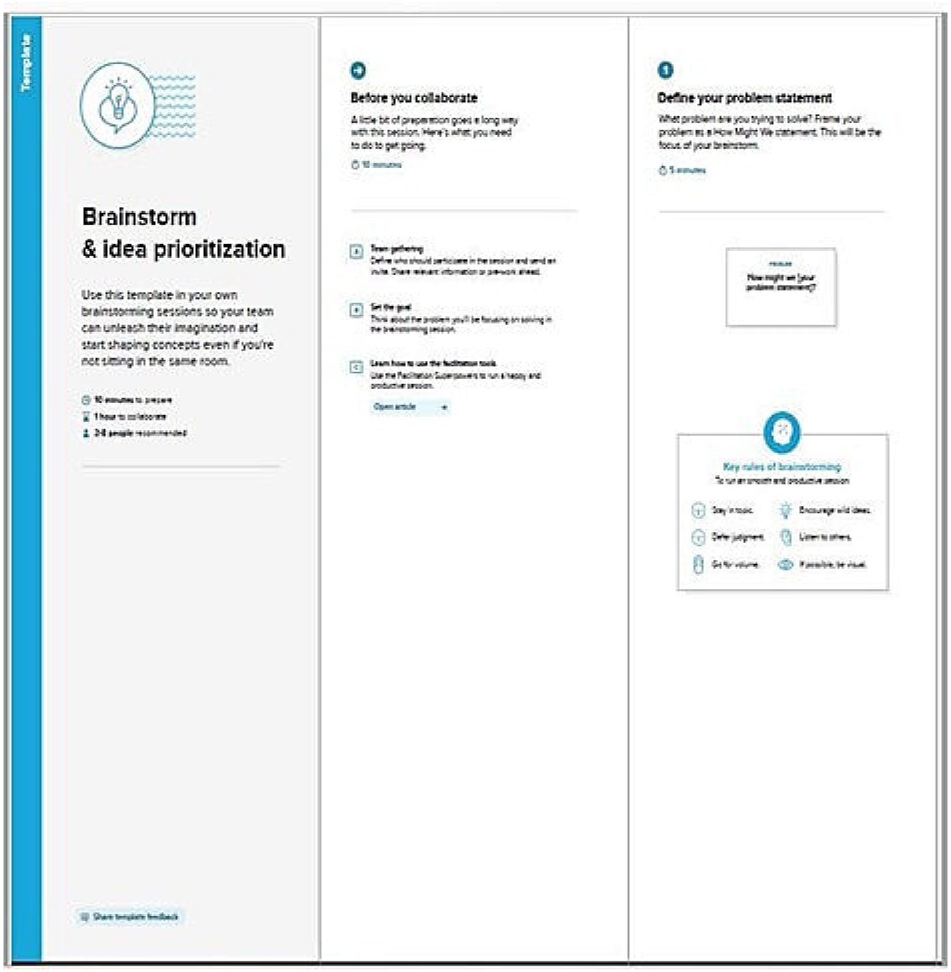
3. IDEATION AND PROPOSED SOLUTION :

3.1 EMPATHY MAP CANVAS

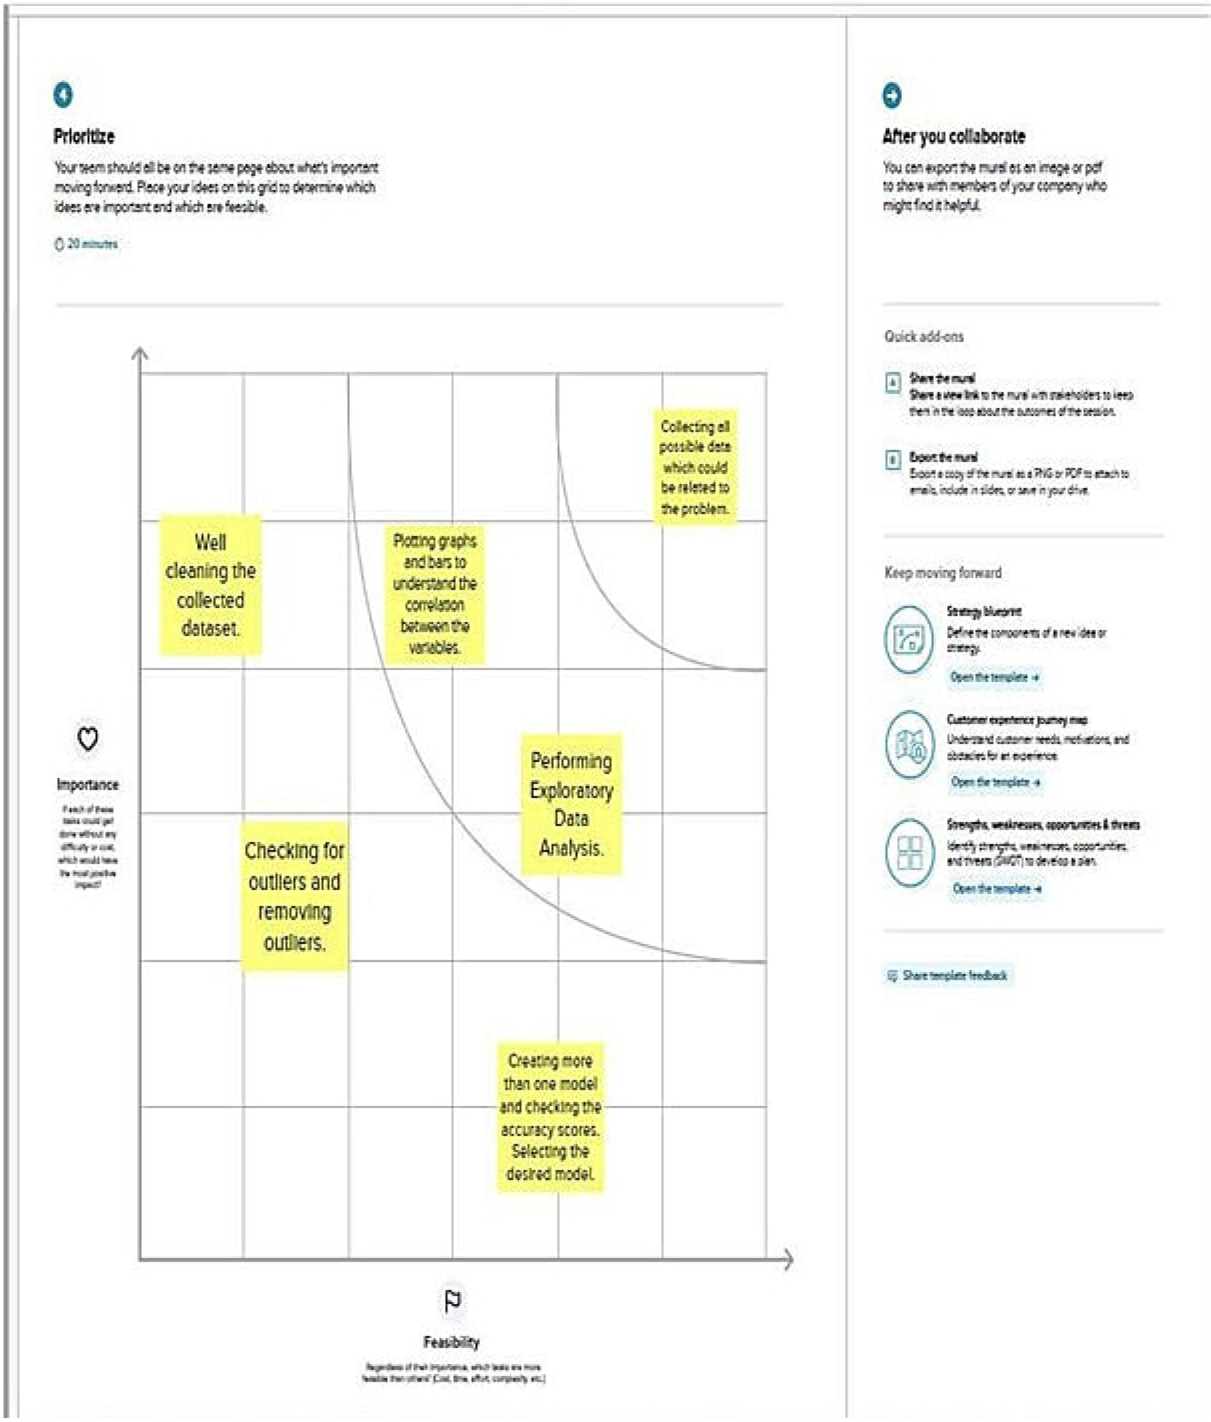


3.2 IDEATION & BRAINSTORMING:

Step-1: Team Gathering, Collaboration and Select the Problem Statement Step-2: Brainstorm, Idea Listing and Grouping



Step-3: Idea Prioritization



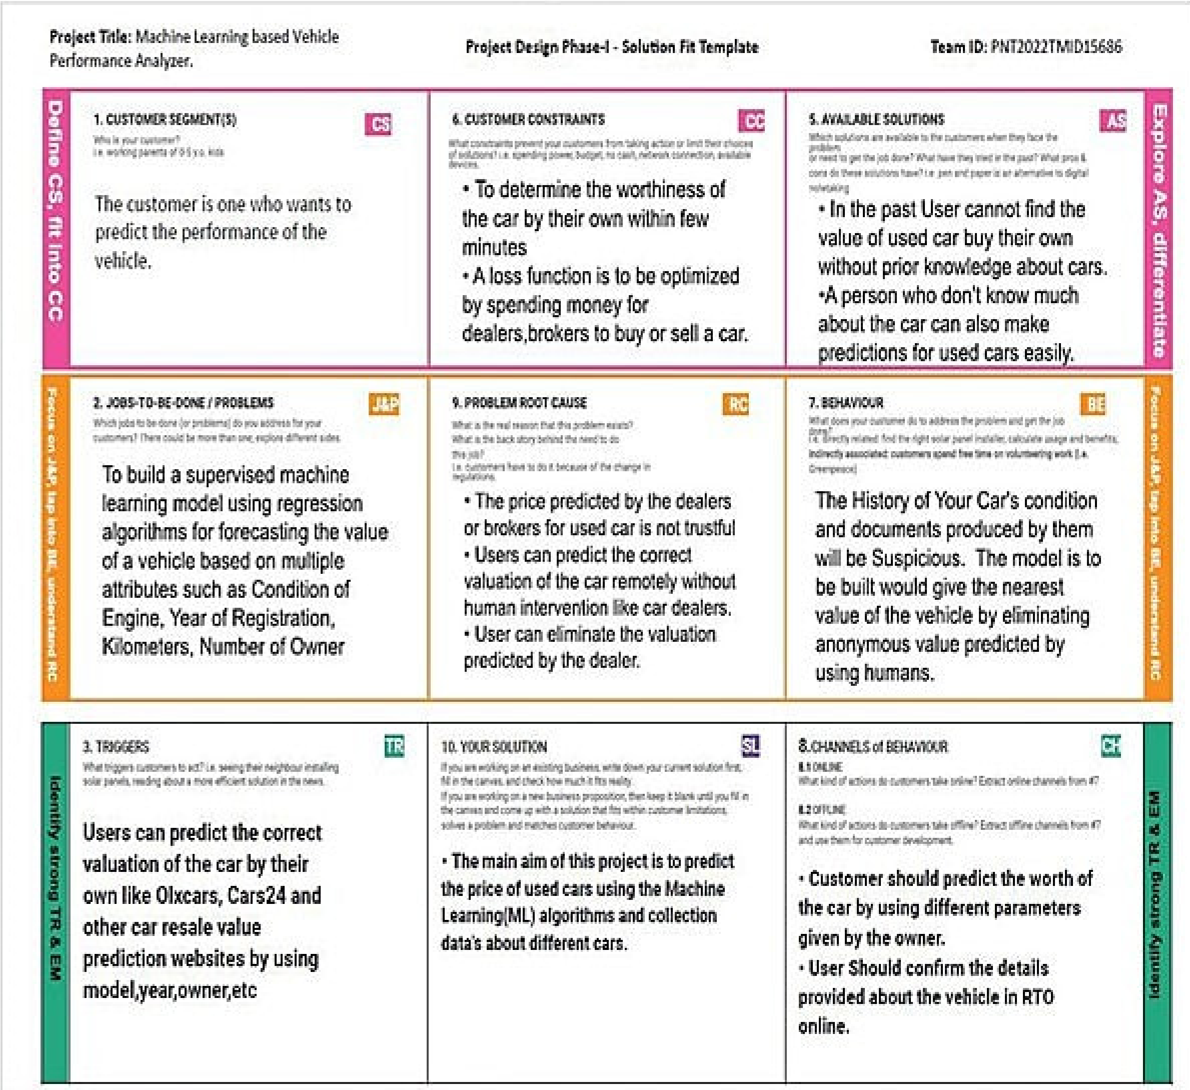
3.3 PROPOSED SOLUTION:

S.No.	Parameter	Description
1.	Problem Statement (Problem to be solved)	The main objective of this project is to enable user to analyse their vehicle performance without external assistance quickly and accurately using little to no time. This performance can then be used to estimate the price of the car which can be used for both buying and selling a customer’s vehicle.
2.	Idea / Solution description	The solution includes identifying a machine learning algorithm in this case a model is integrated with a web application interface which help user to analyse vehicle performance anywhere and anytime using just the internet
3.	Novelty / Uniqueness	By selecting the optimal regression model that suits the application, the time that is taken to analyse performance is significantly reduced and the amount of effort put in by the user is also reduced significantly.

4.	Social Impact / Customer Satisfaction	By using this application power using a machine learning model, time and cost spend in analysing a vehicle's performance is reduced, and the process of setting a price for buying and selling second hand used vehicles becomes a straight forward process with customer satisfaction increasing on both the parties of transaction
5.	Business Model (Revenue Model)	The application can use two revenue model, subscription based in which the user pays a small amount of fee every month to get services or pay to use where customer's pay significantly less for each prediction according to their need.

6.	Scalability of the Solution	The project is highly scalable, as people of all ages are customer segments as almost everyone owns vehicle in today’s world. Also the change in vehicle specification is very low from region to region, so this helps scaling the project quite easy

3.4 PROBLEM SOLUTION FIT:



Project Title: Machine Learning based Vehicle Performance Analyzer.

Project Design Phase-I - Solution Fit Template

Team ID: PNT2022TMID15686

Define CS, fit into CC

1. CUSTOMER SEGMENT(S) CS

Who is your customer?
i.e. working parents of 0-5 y.o. kids

The customer is one who wants to predict the performance of the vehicle.

6. CUSTOMER CONSTRAINTS CC

What constraints prevent your customers from taking action or limit their choices of solutions? i.e. spending power, budget, no cash, network connection, available devices.

- To determine the worthiness of the car by their own within few minutes
- A loss function is to be optimized by spending money for dealers,brokers to buy or sell a car.

5. AVAILABLE SOLUTIONS AS

Which solutions are available to the customers when they face the problem
or need to get the job done? What have they tried in the past? What pros & cons do these solutions have? i.e. pen and paper is an alternative to digital notetaking

- In the past User cannot find the value of used car buy their own without prior knowledge about cars.
- A person who don't know much about the car can also make predictions for used cars easily.

Explore AS, differentiate

Focus on J&P, tap into BE, understand RC

2. JOBS-TO-BE-DONE / PROBLEMS J&P

Which jobs to be done (or problems) do you address for your customers? There could be more than one; explore different sides.

To build a supervised machine learning model using regression algorithms for forecasting the value of a vehicle based on multiple attributes such as Condition of Engine, Year of Registration, Kilometers, Number of Owner

9. PROBLEM ROOT CAUSE RC

What is the real reason that this problem exists?
What is the back story behind the need to do this job?
i.e. customers have to do it because of the change in regulations.

- The price predicted by the dealers or brokers for used car is not trustful
- Users can predict the correct valuation of the car remotely without human intervention like car dealers.
- User can eliminate the valuation predicted by the dealer.

7. BEHAVIOUR BE

What does your customer do to address the problem and get the job done?
i.e. directly related: find the right solar panel installer, calculate usage and benefits; indirectly associated: customers spend free time on volunteering work (i.e. Greenpeace)

The History of Your Car's condition and documents produced by them will be Suspicious. The model is to be built would give the nearest value of the vehicle by eliminating anonymous value predicted by using humans.

Focus on J&P, tap into BE, understand RC

Identify strong TR & EM

3. TRIGGERS TR

What triggers customers to act? i.e. seeing their neighbour installing solar panels, reading about a more efficient solution in the news.

Users can predict the correct valuation of the car by their own like Olxcars, Cars24 and other car resale value prediction websites by using model,year,owner,etc

10. YOUR SOLUTION SL

If you are working on an existing business, write down your current solution first, fill in the canvas, and check how much it fits reality.
If you are working on a new business proposition, then keep it blank until you fill in the canvas and come up with a solution that fits within customer limitations, solves a problem and matches customer behaviour.

- The main aim of this project is to predict the price of used cars using the Machine Learning(ML) algorithms and collection data's about different cars.

8.CHANNELS of BEHAVIOUR CH

8.1 ONLINE
What kind of actions do customers take online? Extract online channels from #7

8.2 OFFLINE
What kind of actions do customers take offline? Extract offline channels from #7 and use them for customer development.

- Customer should predict the worth of the car by using different parameters given by the owner.
- User Should confirm the details provided about the vehicle in RTO online.

Identify strong TR & EM

4. REQUIREMENT ANALYSIS

4.1 FUNCTIONAL REQUIREMENTS

Following are the functional requirements of the proposed solution.

FR No.	Functional Requirement (Epic)	Sub Requirement (Story / Sub-Task)
FR-1	User Registration	Registration through Form Registration through Gmail Registration through LinkedIN
FR-2	User Confirmation	Confirmation via Email Confirmation via OTP.
FR-3	Add Vehicles to Account	Register vehicles through registration number and identify the model.
FR-4	Get attributes of vehicles as inputs	Use a form to obtain input.
FR-5	Predict the performance of the vehicle	Use techniques such as dimensionality reduction and feature selection to pre process data and handle missing values.
FR-6	Tracking the vehicle performance	Use a machine learning model to predict the performance of the vehicle

FR-7	Tracking the vehicle performance	Use storage techniques to store predicted performance from time to time and track them
FR-8	Interact with the user	Use a web application interface developed using HTML to interact with user.

4.2 NON-FUNCTIONAL REQUIREMENTS:

Following are the non-functional requirements of the proposed solution

FR No.	**Non-Functional Requirement**	**Description**
NFR-1	**Usability**	The project Is made easy to use by any one using traditional method of web designing.
NFR-2	**Security**	Security is enabled by providing proper authentication strategies and incorporating some form of encryption.
NFR-3	**Reliability**	The machine learning model is chosen in such a way that it is most suitable for the field of application and makes accurate

		prediction almost all the time.
NFR-4	**Performance**	The performance will be improved by choosing efficient algorithms making predictions in less time
NFR-5	**Availability**	It provides an efficient outcome and has the ability toincrease or decrease the performance of the system based on the datasets.
NFR-6	**Scalability**	The application is highly scalable as vehicle performance is measured in every country.

7. CODING & SOLUTIONING

7.1 FEATURE 1

The proposed system here is a machine learning based vehicle performance analyzer where users can enter different attributes associated with a vehicle and obtain its performance in this case mileage per gallon of fuel instantly. To choose a optimized machine learning algorithm we train most of the regression models to find the most suitable to approach this prediction. Among all the different models used it is inferred that decision tree regression seems to score high in performance metrics hence is chosen as the modelto predict vehicleperformance. Once the model is built and trained and when becomes ready for prediction, the model is dumped in a pickle file which can then be imported in application that requires it. Then create a flask application to use this pickled model to predict vehicle performance. On the other hand insteadof pickling the model is deployed on IBM cloud and imported using the API key.

The below code is the model for Decision tree Algorithm. from sklearn.tree import DecisionTreeRegressor

model=RandomForestRegressor(n_estimators=30,random_state=0)

model.fit(X_train,y_train)

prediction=model.predict(X_test)

The model is dumped into pickle and can be

used as show below import pickle

pickle.dump(dt,open('model.pkl','wb'))

The flask app is createdto act as an interfaceto predict the quality from the details the user is giving,

import numpy as np

from flask import Flask, request, jsonify,

render_template import pickle

app = Flask(__name__)
model = pickle.load(open('model.pkl',

'rb')) @app.route("/")

def home():

8. TESTING

8.1 TEST CASES:

a. Verify that the user could able to use that web page

b. Verify that the user could able to enter the value

c. Verify that the values entered by the user are computed

d. Verify that the user could able to see the predicted value

8.2 USER ACCEPTANCE TESTING

1. Defect Analysis

This report shows the number of resolved or closed bugs at each severity level, and how they were resolved

Resolution	Severity 1	Severity 2	Severity 3	Severity 4	Subtotal
By Design	7	4	2	3	17
Duplicate	1	0	3	0	4
External	2	3	0	1	6
Fixed	10	2	4	15	31
Not Reproduced	0	0	1	0	1
Skipped	0	0	1	1	2
Won't Fix	0	3	2	1	6
Totals	20	12	13	21	66

2.Test Case Analysis

This report shows the number of test cases that passed, failed and untested

Section	**Total Cases**	**Not Tested**	**Fail**	**Pass**
Print Engine	6	0	0	6
Client Application	45	0	0	45
Security	2	0	0	2
Outsource Shipping	2	0	0	2
Exception Reporting	7	0	0	7
Final Report Output	3	0	0	3
Redirecting	1	0	0	1

9. RESULTS:

9.1 PERFORMANCE METRICS:

Here to predictthe performance of the above model two main measuresare used. Model Accuracy and the r-square value. Then the mean squared error for the value is also checked.R-squared is a statistical measureof how close the data are to the fitted regression line. It is also known as the coefficient of determination, or the coefficient of multiple determination for multiple regression. The accuracy of the value is: 0.8948289556923962.

10. ADVANTAGES AND DISADVANTAGES:

Advantages:

- The model enables an user to immediately analyzea vehicle's performance and provide results instantly.
- The model uses decision tree regression which is proved to be more suitable for such cases.
- The model takes into account various error factors and acts upon them to produce almost accurate results.
- It automates the tedious and repetitive tasks.

Disadvantages:

- When dimensionof the data is high the modeltends to take little more time.
- This model is only suitable for measuring performance in terms of miles per gallons, and might not be suitablefor other performance measure such as comfort etc.

11. CONCLUSION:

Vehicle performance prediction by using this model becomes easy and simple. It enables users of all category to predict their vehicle’s performance without needing a deeper knowledge of know how about the vehicle. By employing this customers can also decide to sell or buy vehicles and it makes this transaction easier and clearer. The above model that is decision tree regression used is very much suitable to this scenarios and has an accuracy of about 89.48289556923962. It is on an overall scale doing good keeping prediction closer to accurate values.

12. FUTURE SCOPE:

The scope for this project is quite high due to high scalable nature. As almost everyone in the world owns a vehicle and everyone wants to know how their vehicle performing. This is a global scale and task which can be fulfilled using this model. The scalable and reliable nature based on its accuracy provides the clearance for the model to be employed everywhere for vehicle performance prediction.

<h3>Cylinders

vs mpg</h3>

#

# Let's calculate the Pearson Correlation Coefficient and P-
value of 'Cylinders' and 'mpg'.

pearson_coef, p_value = stats.pearsonr(dataset['cylinders'],
dataset['mpg'])

print("The Pearson Correlation Coefficient is", pearson_coef,
" with a P-value of P =", p_value)

# <h5>Conclusion:</h5>
```

<p>Since the p-value is $<$ 0.001, the correlation between cylinders and mpg is statistically significant, and the coefficient of ~ -0.775 shows that the relationship is negative and moderately strong.

#

<h3>Displacement

vs mpg</h3> #

Let's calculate the Pearson Correlation Coefficient and P-value of 'Displacement' and 'mpg'.

```
pearson_coef, p_value = stats.pearsonr(dataset['displacement'],
dataset['mpg'])
```

```
print("The Pearson Correlation Coefficient is", pearson_coef,
" with a P-value of P =", p_value)
```

<h5>Conclusion:</h5>

<p>Since the p-value is $<$ 0.1, the correlation between displacement and mpg is statistically significant, and the linear negative relationship is quite strong (~-0.809, close to -1)</p>

<h3>Horsepower vs mpg</h3>

Let's calculate the Pearson Correlation

```
Coefficient and P-value of 'horsepower' and 'mpg'.

pearson_coef, p_value = stats.pearsonr(dataset['horsepower'],
dataset['mpg'])

print("The Pearson Correlation Coefficient is", pearson_coef,
" with a P-value of P =", p_value)

# <h5>Conclusion:</h5>

# <p>Since the p-value is $<$ 0.001, the correlation between
horsepower and mpg is statistically significant, and the
coefficient of ~ -0.771 shows that the relationship is negative
and moderately strong.

# <h3>Weght vs mpg</h3>

# Let's calculate the Pearson Correlation Coefficient and P-
value of 'weight' and 'mpg'

pearson_coef, p_value = stats.pearsonr(dataset['weight'], dataset['mpg'])

print("The Pearson Correlation Coefficient is", pearson_coef,
" with a P-value of P =", p_value)

# <h5>Conclusion:</h5>

# <p>Since the p-value is $<$ 0.001, the correlation between
weight and mpg is statistically significant, and the linear
negative relationship is quite strong (~- 0.831, close to -1)</p>
```

```
#

<h3>Acceleration

vs mpg</h3> #

# Let's calculate the Pearson Correlation
Coefficient and P-value of 'Acceleration' and 'mpg'

pearson_coef, p_value = stats.pearsonr(dataset['acceleration'],
dataset['mpg'])

print("The Pearson Correlation Coefficient is", pearson_coef,
" with a P-value of P =", p_value)

# <h5>Conclusion:</h5>

# <p>Since the p-value is $>$ 0.1, the correlation between
acceleration and mpg is statistically significant, but the linear
relationship is weak (~0.420).</p>

# <h3>Model year vs mpg</h3>

# Let's calculate the Pearson Correlation Coefficient and P-
value of 'Model year' and 'mpg'.

pearson_coef, p_value = stats.pearsonr(dataset['model year'],
dataset['mpg'])

print("The Pearson Correlation Coefficient is", pearson_coef,
" with a P-value of P =", p_value)
```

```
# <h5>Conclusion:</h5>

# <p>Since the p-value is $<$ 0.001, the correlation between
model year and mpg is statistically significant, but the linear
relationship is only moderate (~0.579).</p>

#

<h3>Origin

vs

mpg</h3>

#

# Let's calculate the Pearson Correlation Coefficient and P-
value of 'Origin' and 'mpg'.

pearson_coef, p_value = stats.pearsonr(dataset['origin'], dataset['mpg'])

print("The Pearson Correlation Coefficient is", pearson_coef,
" with a P-value of P =", p_value)

# <h5>Conclusion:</h5>

# <>Since the p-value is $<$ 0.001, the correlation between
origin and mpg is statistically significant, but the linear
relationship is only moderate (~0.563).</p>
